Final comments from the Advocate

The proposer has already made the suggested modifications and agreed upon the following citation

The compiler translated human-readable English keywords or commands into machine-readable instructions or code, thus creating well-defined communication between human programmers and computers. It made possible programs written for different computers rather than a single machine. Based on the compiler, the Flow-Matic was first used in the UNIVAC. This shaped the creation of COBOL, a programming language that facilitated the information highway and the beginning of the IT industry.

The two experts strongly supported the proposal.

As an advocate , I approve this proposal moving forward for the IEEE history Committee's consideration.
